

Use Case:	Identify friends
Primary Actor:	All users
Goal in Context:	To find the profiles of other users in the system that the user knows, or profiles that the user is interested in keeping up with.
Preconditions:	The user must have an account, be logged in, and must have a desire to find other users in the system. The user must have an interest in the activities of other users.
Trigger:	Selecting a function to search for users in the system. Selecting an Add Friend function on another user's profile.
Scenario:	<ul style="list-style-type: none"> • User enters a potential name of another user. • User views entries of other user profiles in the system. • User selects to confirm the addition of a friend.
Exceptions:	<ul style="list-style-type: none"> • Overwhelmingly large search results. The user will need to search more specifically or potentially navigate a lot of information. • The system will not accept contentless queries.

The following fields are optional	
Priority:	This has moderate to low priority. Many of the other user cases of the system can be accomplished without a friend finding use case.
